Universal Fix for Windows 11 Systems

I've found that VPR on Windows 11 based systems appears to have problems - this is the first thing I will try when troubleshooting issues with VPR on Win 11:

-Completely uninstalled VPR
-Re-installed VPR (L version), specifically as admin, making sure to change the install path to C:\Program Files - chopping off the (x86) on the end.
- After installation has finished, right click the program exe, run as admin - shortcut on desktop may be broken, may need to run VPR.exe directly as admin.
-Register software, provided him with the license key and org name
-Closed software.
-Replaced vsa.mde file inside the install directory with:
http://www.vpronline.com/automatic_update/vsa.mde

This does not solve the issue where users will try to "manually update the drug database" and get a message telling them that they need an update.

But it does give them the latest database.
